Master's Thesis in Informatics

Detection and Dialog-Based Self-Reporting of Stress for Eating Behavior Prediction

Erkennen und dialogbasiertes Self-Reporting von Stress zur Vorhersage des Essverhaltens

Author:	Wenjian Li
Supervisor:	Prof. Dr. Georg Groh
Advisor:	Monika Wintergerst
Submission Date:	15.05.2020

I confirm that this master's thesis in informatics is my own work and I have documented all sources and material used.

Munich, 15.05.2020

Wenjian Li

Acknowledgments

I would like to thank everyone who has offered me help and support on this thesis:

Prof. Dr. Georg Groh, for his supervision throughout the project and the inspirations he's been giving me during my studies at TUM, leading my way into the amazing field of social computing.

Ms. Monika Wintergerst, who has offered me great advice, guidance, and feedback with her expertise and patience, as well as care and understanding in this difficult time of the global pandemic.

Audrey, who has always been supporting and encouraging me not only throughout the project, but also my life, with her beautiful soul and unconditional love.

My mom Chunyan and my dad Zhenliang, who are not only parents but also life teachers, always supporting my education and guiding me with positivity and wisdom.

All the participants in the studies, who have provided crucial input and feedback to the project.

Last but not least, my friends, who have been offering me great social support despite social distancing.

1 Introduction

Eating is an activity that people perform on a daily basis. It is the essential source of ingredients for us humans. Our nutrition intake, in turn, affects our health. However, people's choice of food cannot be simply regulated in terms of time and ingredients to make the best health effect out of it, because it is a highly emotional behavior (Gardner et al. 2014). According to Gardner et al., both positive and negative moods affect food choices. Especially, having negative moods often leads one to pick indulgent food instead of healthy food to cope with the emotion.

Stress is a common reaction to the environment that is often linked to negative emotions. In fact, Du et al. (2018) suggests that there is a significant positive correlation between the level of stress one has and the degree of negative emotions one experiences. Combining the results from both studies, it is therefore highly likely that food choices could be affected by stress.

A study by Mental Health Foundation (2018) suggests that a majority of the population in the United Kingdom may have been overwhelmed with stress throughout the year 2018. This suggests that many of the health problems resulted from unhealthy eating behaviors could be linked to stress. However, regulating eating behavior often requires a deep understanding of nutrition and diet, which is not the possession of non-experts. There are professionals who are out there to offer counseling services on people's diet, but this is understandably not accessible by the general public, given the pervasiveness of stress among them. Moreover, the specific eating behavior resulted from stress differs among individuals (TODO 2020). It is, therefore, necessary to work out an individual's eating behavior under the influence of stress without professional medical intervention.

1.1 Section

1.1.1 Subsection

See Table 1.1, Figure 1.1, Figure 1.2, Figure 1.3.

Table 1.1: An example for a simple table.

A	B	C	D
1	2	1	2
2	3	2	3

Figure 1.1: An example for a simple drawing.
